

Atlas Core 3.0 Release Notes

Published: 2026-03-18

General availability

Atlas Core 3.0 became generally available on 18 March 2026. The release increases organization capacity and searchable history, introduces API v2, and requires Northstar Runtime 8.4 or later.

Semantic indexing rollout

Semantic indexing was opt-in at the 18 March launch. It became the default for workspaces created on or after 15 April 2026; existing workspaces keep their configured indexing mode until an administrator changes it.

API transition

API v2 is the supported automation interface in Atlas Core 3.0. API v1 remains temporarily available through 30 June 2026 so operators can migrate integrations before its removal on 1 July.

Automation payload change

The v2 automation payload uses `workspace_key` where v1 used `project_key`. Integrations that send `project_key` to `/api/v2` fail validation and must rename the field before switching endpoints.
