

Atlas Core 3.0 Product Specification

Published: 2026-03-18

Supersedes: atlas-core-spec-2-4

Organization capacity

Atlas Core 3.0 supports up to 500 active workspaces in one organization. The limit applies to active workspaces only; archived workspaces remain excluded until they are restored.

Activity history

Atlas Core 3.0 retains searchable activity history for 90 days. Administrators can still export audit data for external retention, but an export does not extend the history searchable inside Atlas Core.

Runtime requirement

Atlas Core 3.0 requires Northstar Runtime 8.4 or later. A deployment running Runtime 7.9 may continue to host Atlas Core 2.4, but it must upgrade the runtime before Atlas Core 3.0 is installed.

Automation API

The supported automation endpoint for Atlas Core 3.0 is /api/v2. API v1 remains available during the transition through 30 June 2026 and is removed on 1 July 2026; new integrations should use v2 immediately.

Incremental synchronization

Atlas Core 3.0 can schedule incremental synchronization as often as every 5 minutes. The configured interval controls synchronization with connected sources and is unrelated to the offline event buffer provided by Atlas Edge.
